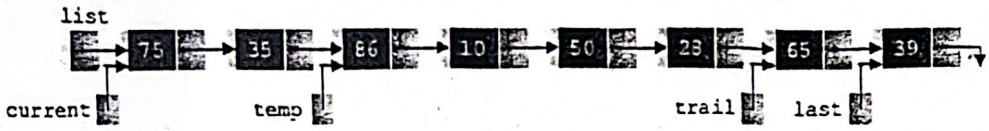
OODS / Fall25 / Quiz-02 / CLO-02	18/09/2025	Marks: 12+4+4=20
Name: solution	Roll No: _____	Section: _____

Given the following link list, with few pointers as shown



1. Comment on each of the following statement. If a statement is resulting into any change in the above link list, then explain that change. If a statement is wrong, then explain the issue with the statement.

- `temp->link->link = NULL;`

  75 → 35 → 86 → 10 → 50 → NULL

- `trail->link = 0;`

  75 → 35 → 86 → 10 → 50 → 28 → 65 → NULL

- `*temp = last;`

  error

- `list = 75;`

  error

- `temp->link->info = 75;`

  75 → 35 → 86 → 75 → 50 → 28 → 65 → 39 → NULL

- `current->info = trail->link;`

  error

- `*list = *last;`

  39 → NULL

- `current = last;`

  No change on list

- `cout << trail->link->link->info;`

  error

- `trail->link = NULL;`
  `delete last;`

  75 → 35 → 86 → 10 → 50 → 28 → 65 → NULL

- `temp-> link= trail;`

  75 → 35 → 86 → 65 → 39 → NULL

- `current = current->link;`
  `current->link = temp->link;`

  75 → 35 → 10 → 50 → 28 → 65 → 39 → NULL

2. Show what is produced by the following C++ code. Assume the node is the usual info-link form with the info of the type int. (list, trail, and current are pointers of type nodeType.)

```
current = new nodeType;
current->info = 72;
current->link = NULL;
trail = current;
current = new nodeType;
current->info = 46;
current->link = trail;
list = current;
current = new nodeType;
current->info = 52;
list->link = current;
current->link = trail;
trail = current;
current = new nodeType;
current->info = 91;
current->link = trail->link;
trail->link = current;
current = list;
while (current != NULL)

{
    cout << current->info << " ";
    current = current->link;
}
cout << endl;
```

46 52 91 72

3. Make a function that Swap the first and the last value of a link list. Note that there is only head pointer and no tail pointer.

```
void LinkList::SwapFirstLast( )
{
    if (head == NULL || head->link == NULL)
        return;

    Node* curr = head;

    while (curr->link != NULL)
        curr = curr->link

    int temp = head->data;
    head->data = curr->data;
    curr->data = temp;

}
```
